Lawn Care Program Details

1st Application - Bio-Nutrients* crabgrass control and fertilizer - For your first visit, M&I will apply fertilizer and Bio-Nutrients that promotes early spring green up along with crabgrass prevention and targeted weed control, a great application to wake up your lawn. A thorough inspection of your lawn will also be conducted to advise on any prior season concerns that need to be addressed.

2nd Application - Bio-nutrients*, fertilizer and targeted weed controls - This will promote greener color and strengthen your root system while reducing the amount of nitrates and pesticides that traditional lawn companies use this time of the year. A strong root system creates a thicker, healthier lawn that naturally defends against weeds and annual grasses.

3rd Application - Bio-nutrients*, fertilizer and targeted weed controls - This will strengthen your lawn while controlling those pesky weeds. The bio-nutrient supplement also helps your lawn naturally endure the stress of summer by improving the cell structure of your grass. A grub preventative treatment is recommended at this time to ensure that white grubs do not devastate your lawn. (A supplemental service provided at an additional charge for Grub Control).

4th Application - Fertilizer, targeted weed control and/or post-emergent controls - During this mid-year application, we evaluate and target the specific requirements of your lawn. Whether it's a boost of fertilizer, a targeted weed treatment or additional post emergent to control problem grasses, you can count on us to do the right thing for your lawn.

5th Application - Bio-nutrients*, fertilizers and targeted weed controls - This will help your lawn recover from the stress of summer and take care of any unwelcome weeds. Core aeration and over seeding are recommended at this time to reduce soil compaction and introduce improved varieties of grass to your lawn. (A supplemental service provided at an additional charge for Aeration).

6th Application - Balanced fertilizer - Prior to your lawn going into winter dormancy we will apply a final fertilization to feed your root system and help the lawn endure the stress of winter more effectively. This application will also help your lawn green up earlier next spring.

*What are Bio-Nutrient Supplements?

Bio-nutrient supplements improve plant uptake while reducing the quantity of fertilizer and pesticides needed to deliver superior results. They also naturally improve root density and cell wall thickness, which improves drought tolerance and insect/disease resistance.
